Bayes' Theorem

Condition A   Condition B

a-i   i   b-i

N

Week 14

Card example: conditions

52 cards

Condition A

26 Red cards

Condition B

4 Jacks
Condition A: Card is Red
Condition B: Card is Jack

Card example: intersection

Condition A   Condition B

26   4

?

52

Card example: intersection

Condition A Condition B

26 2 4

52
Answer: Jack of Hearts,
Jack of Diamonds

J♡ J◇

Probabilities

Marginal probability:
$$P(Red) = \frac{26}{52} = \frac{1}{2} \qquad P(Jack) = \frac{4}{52} = \frac{1}{13}$$

Conditional probability:

What is the probability of Jack if (*condition*) card is Red?

26   2

$$P(Jack \mid Red) = \frac{2}{26} = \frac{1}{13}$$

condition

Joint probability:

What is the probability of Jack and Red?

$$P(Red \cap Jack) = \frac{2}{52} = \frac{1}{26}$$

intersection

5

Bayes' Theorem

What is the probability of A if B happened?

$$P(A \mid B) = \frac{i}{b}$$

Condition A   Condition B

a-i   i   b-i

N

What is the probability of A and B happening?

$$P(A \cap B) = \frac{i}{N}$$

What is the probability of B happening?

$$P(B) = \frac{b}{N}$$

$\Rightarrow$

$$P(A \mid B) = \frac{P(A \cap B)}{P(B)}$$

6

Bayes' Theorem

The probability of A if B happened:

$$P(A \mid B) = \frac{P(A \cap B)}{P(B)}$$

More often, we calculate the probability of both A and B happening:
$$P(A \cap B) = P(B) * P(A \mid B)$$

Probability Tree

What is the probability of us getting stuck in a jam today? Intuition suggests that in order to calculate this probability, we need to sum up the following multiplication results:

$P(Jam) = 0.1*0.8 + 0.9*0.3 = 0.35$

In fact, we are applying Bayes' theorem:
$P(Jam) = \underline{P(Rain) * P(Jam \mid Rain)} +$
$\qquad + \underline{P(No\ Rain) * P(Jam \mid No\ Rain)}$

DS Interview question: you have 12 beads – 7 black and 5 white. What is the probability of taking 1b+1w simultaneously? (35/66)

Rain
10%
Jam
80%
No Jam
20%

No Rain
90%
Jam
30%
No Jam
70%

Independence of events

What if one would like to learn if two events are independent? To answer it, we need to understand what is independent? Intuition hints to us that events A and B are independent if the probability that event B will occur remains the same, regardless of whether event A has occurred or not:

$$P(B) = P(B \mid A)$$

We could've achieved the above formula from the following ones:

independent events: $P(A \cap B) = P(A) * P(B)$
conditional events: $P(A \cap B) = P(A) * P(B \mid A)$

Independence of events: Case

Suppose we took a survey from 375 people and asked if they've visited theater, cinema or concert in the last year at least once:

Let's check if visiting cinema and concert are independent events:

P (cinema) * P (concert) = 100/375 *

* 115/375 = 0.8177

P (cinema ∩ concert) = 25/375 = 0.666

Events are dependent, as 0.8177 ≠ 0.666

None 140

60

15   5   20

45   10   80

cinema

theater   concert

Now let's check if visiting theater and cinema are independent events:

P (theater) * P (cinema) = 75/375 * 100/375 = 0.5333

P (cinema ∩ concert) = 20/375 = 0.5333

Events are independent, as 0.5333 == 0.5333
